

Phrase MT

-VS-

Free MT engines

Secure content

Your content stays within our secure EU and cloud-based translation management system - out of the public domain.

Less security

By running your content through Google, you are giving other people access to your work.

AI trainable for more consistency

The MT automatically adapts, learns and remembers how your content is translated and which words you prefer.

Less consistency

You can't feed Google Translate your glossary of key terms; the same words can be translated differently each time.

Formatting and QA

Formatting is done automatically with tags - no manual input required. Plus a final check from a Dialogue project manager.

No formatting

Using Google Translate, you have to manually format your documents: lots of copying & pasting, adding bold, italics, line breaks.

Greater accuracy

Phrase MT uses multiple machine translation softwares at the same time. You can select which ones are best suited to your content.

Less accuracy

Although it has greatly improved over the years, it's not as accurate as combining 20+ MT softwares in one.

Glossary alignment

You can feed the MT your glossary and ensure that the words you want are translated the way you want.

A cheaper option

It saves you money in the short run as it comes at no cost. But does poorly translated content save you money in the long-run...?
